

Africa Weather Hazards Assessment

- 2) Additional rain and high winds are likely as a new storm system approaches

NOTE: Cross hatching regions depict combined wheat, maize, sorghum, and millet crop zones which are active (sowing to harvest) during the current month. (from FAO)

- 3) Hydrological dryness persists

- 4) Drought continues throughout the region

- 5) Reservoir levels remain low throughout the country

- 7) Saturated soil persist as rains continue throughout these regions

- 6) Short-term drought continues; some relief is probable during the upcoming week. The outlined area is the greatest drought concern.

- 1) Tropical cyclone Fari should bring heavy rains to central Madagascar. Watch for re-development in the Mozambique Channel.
